A GUIDE FOR THE COUPLE AND THEIR HELPERS

WEDPLAN

One place to run the whole wedding — and a page of their own for every household you invite.

How to use it · what each part does · where everything lives

Screenshots show fictional sample data ("Mia & Jonah") in the real screens.

START HERE

What WEDPLAN is

A wedding-planning workspace for you, your partner and the close family who are helping — replacing the spreadsheets and the group chats. You run the guest list, the money, the tasks and the invitations from one place, and each household you invite gets its own private page.

Decide who
Guest list, ranking, the cut line

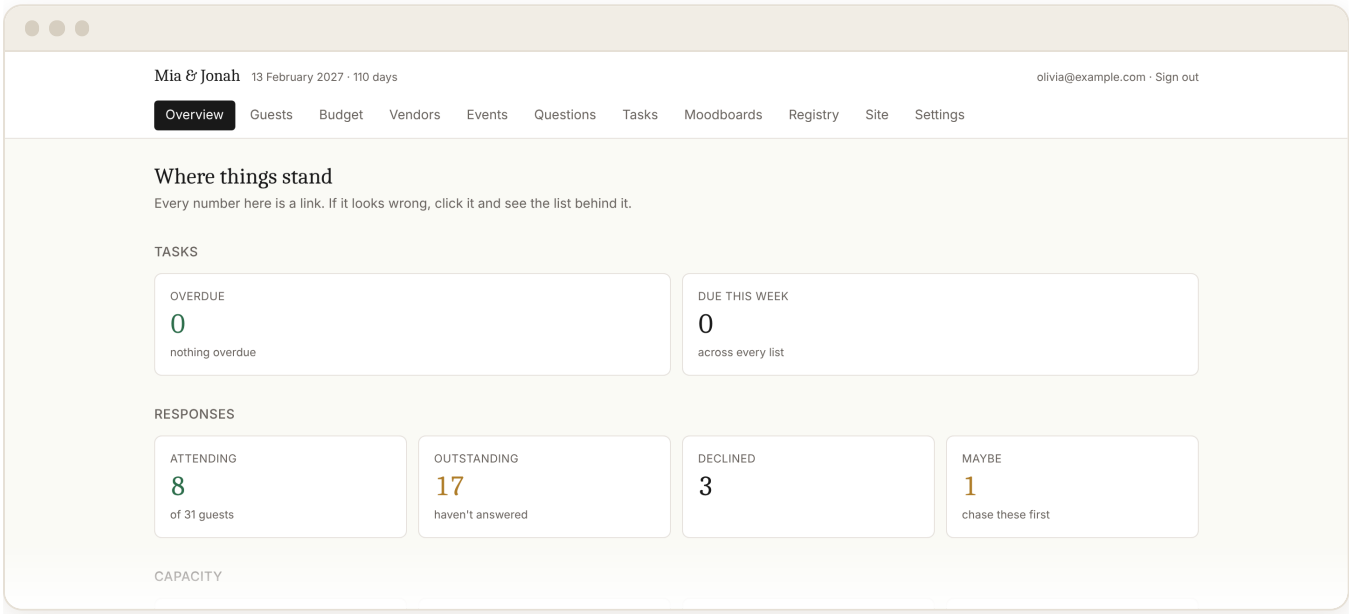

Plan
Tasks, budget, vendors, events

Tell people
Save the date, then invitations

Collect answers
RSVPs, diets, coach seats, songs

Fine-tune
Seating, run sheet, registry

The day
Run sheet, catering numbers

Overview. "Where things stand" is the first screen you see. Every number is a link — if one looks wrong, click it and you land on the list behind it.

A few rules the whole app follows

Money is NZD

Kept to the cent, with a GST setting on each budget line.

Times are the wedding's own

Everything is shown in the timezone you set, wherever you or your guests are.

Guests are never deleted

Removing someone hides them. The record of who you asked always stays.

One wedding, private

Only you and your collaborators can see it. Guests see only their own page.

PART 1

The big idea: one page per household

Most wedding sites are one public page everyone visits. WEDPLAN deliberately isn't. **There is no single website — every household gets its own address, and that page *is* their invitation.**

Anatomy of a household's address

`/w/mia-and-jonah/okonkwo-4f7ak`

The wedding
Same for everyone. Comes from your wedding's name.

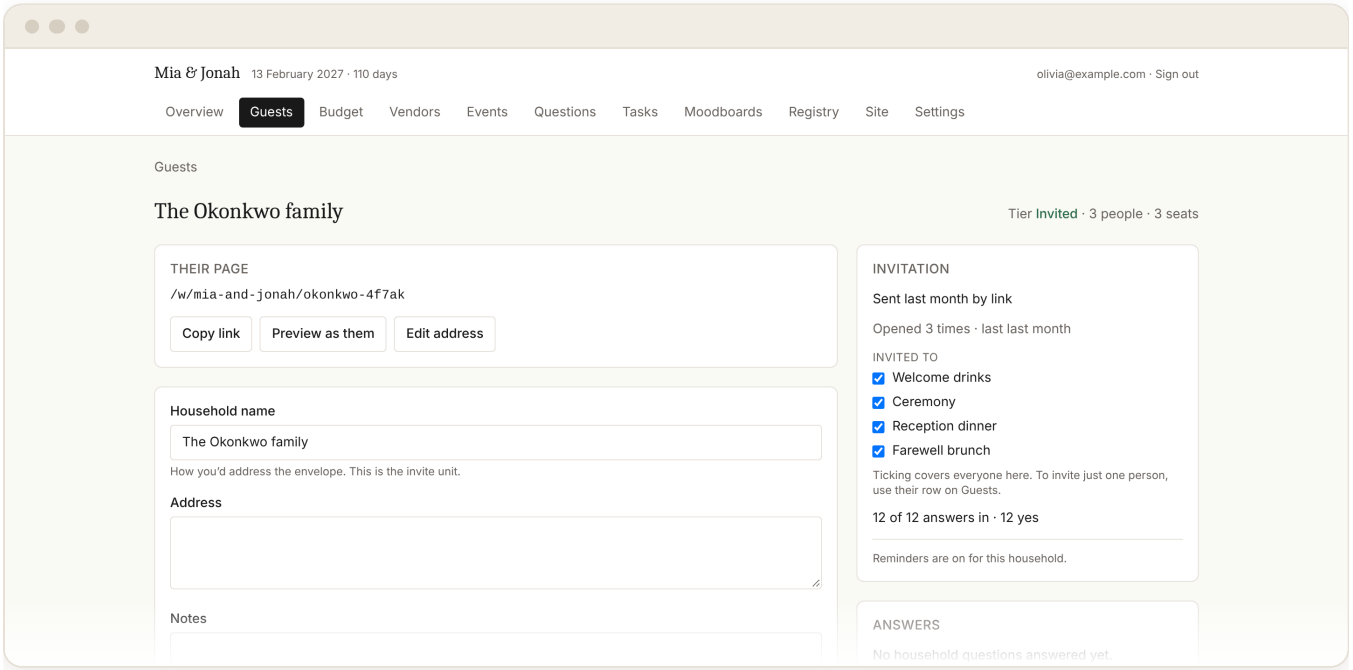

The household label
Just so a link says whose it is. Taken from the household name; you can edit it and old links keep working.

The key
Five random characters. This is what actually protects the page. It never changes unless you *Reissue*.

Behind that address sit the household's names, dietary notes, an RSVP form that can answer on their behalf, coach seats and photo uploads. The label alone would be guessable by anyone who knows you — the random key is not.

TREAT THE LINK LIKE A HOUSE KEY

Send it to that household only. Don't post it publicly. And there is deliberately no shared page: `/w/mia-and-jonah` on its own shows "not found".

Every household has its address from the moment you add it. On the household's screen: *Copy link*, *Preview as them* (see exactly what they will see), and *Edit address*. The right-hand panel shows which events they're invited to and how they've answered.

“The site is the invitation”

You design the wedding site **once**, in the **Site** editor, from blocks — your story, the weekend, RSVP, map, questions and so on. That one design is then shown **separately to every household**. Some blocks are *personal* and change to fit whoever is reading:

BLOCK	WHAT EACH HOUSEHOLD SEES
The weekend	Only the events *they* are invited to, with each event’s own note. A ceremony-and-dinner household never reads about the brunch.
RSVP	Their own people, their own events, their own questions.
The coach	Times and stops, and a way to reserve their own seats.
Your table	Where they’re sitting — but only after the reveal date you choose on the seating plan.
Everything else	Your story, map, FAQ, gallery, travel… reads the same for everybody.

The Okonkwo family
invited to all four events

The Nakamuras
invited to the ceremony and dinner only

Same site, same block — two different weekends.

TWO LINKS THAT ARE NOT PER-HOUSEHOLD

The gift registry is one address you can send to anyone, separate from every invitation. **Moodboard share links** are one per board, no account needed. (Links from earlier versions, `/i/…` and `/rsvp/…`, redirect to the household’s current address.)

PART 2

Save the date vs. invitation

They share a household address, but they are two different pages with two different jobs. The save-the-date is simply the household address with `/save-the-date` on the end.

SAVE THE DATE

`…/okonkwo-4f7ak/save-the-date`

A keepsake card. Nothing to answer.

INVITATION

`…/okonkwo-4f7ak`

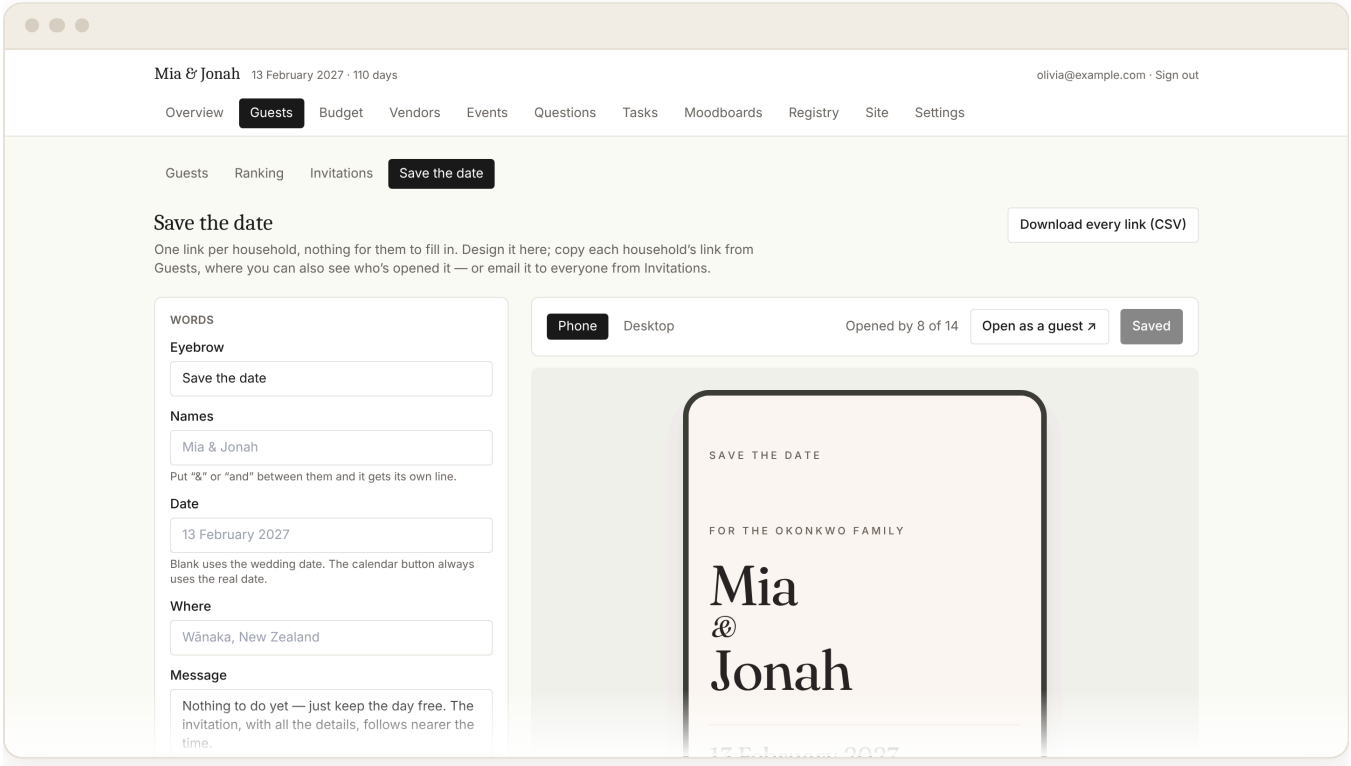

The full page, with their events and the RSVP.

	SAVE THE DATE	INVITATION
Its job	"Block out this date." Goes out early, before details are settled.	"Here's your weekend — please answer." The real thing.
What it shows	A designed card: names, date, place, photos, a short message.	The full site, personalised: their events, RSVP, travel, FAQ, coach.
Asks for an answer?	No.	Yes — the RSVP form.
Needs an invitation first?	**No.** Works for any household, even one you haven't decided to invite yet.	**Yes.** You create the invitation and choose which events the household is invited to.
Designed in	Guests → *Save the date*	*Site* (the block editor)

Goes live	When you press *Save*.	When you press *Publish*. Guests see only the last published version.
Tracked as	“Save the Date Sent” tick, and its own “opened” count.	“Invite Sent” tick, its own opens, and RSVP progress (e.g. 3/4 answered).

Why not just send the invitation early?

- **You may not know who’s invited to what yet.** An invitation is per person, per event. A save-the-date doesn’t need that decided.
- **An invitation asks for answers; a save-the-date must not.** If early opens counted as “read the invitation, no reply”, you’d chase people who’ve only seen the date. Save-the-date opens are counted separately and never as invitation opens.
- **Different jobs, different design.** The save-the-date is a keepsake; the invitation is a working page.
- **You can send it before the list is final.** It needs no invitation, so it can go out while the ranking is still settling.

The save-the-date designer (Guests → Save the date): your words on the left, a live phone preview on the right. Choose a layout (Cover, Editorial, Postcard), a palette, up to six photos, and whether to greet each household by name or add “add to calendar” buttons.

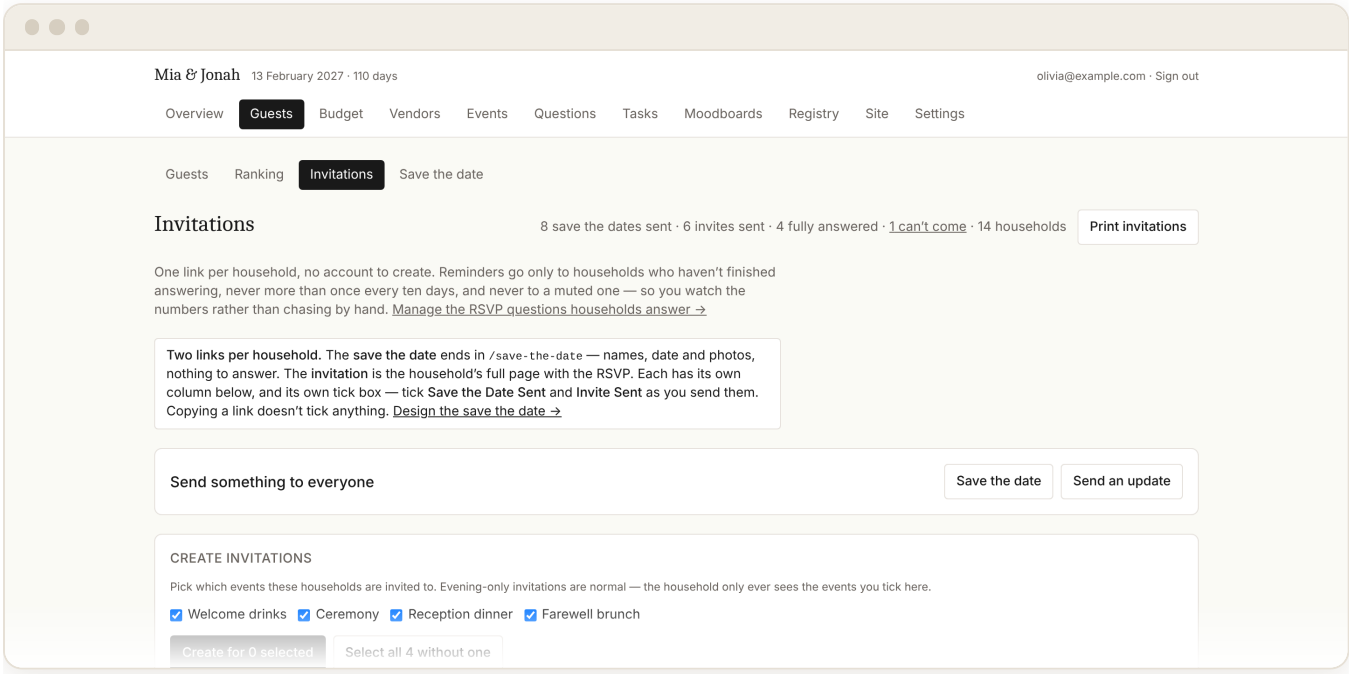

“I ALREADY KNOW I CAN’T COME”

The save-the-date has a quiet button for guests who are certain they can’t make it. It **flags** that guest — it deliberately does *not* record an RSVP. Flagged guests drop out of headcount, catering and per-head budget numbers, but stay on the list as invited, so you still know who you asked. If they later answer Yes, the Yes wins. The button only acts when pressed — never when the page opens — so email link-scanners can’t trigger it.

PART 3

Sending links and keeping track

Everything lives on **Guests → Invitations**: one row per household, with a column for each of the two links.

Invitations. Tick *Save the Date Sent* and *Invite Sent* yourself as you send. Opened counts and RSVP progress (*Answers*) update as households respond. "No invitation yet" rows are the households you haven't created one for.

Create an invitation

In *Create invitations*, tick the events these households are invited to, select the households (or *Select all without one*), and press *Create*. A household only ever sees the events you tick. To invite or remove *one person* from one event, use the grid on the Guests tab.

BUTTON	WHAT IT DOES
Send / Resend	Emails it to guests in the household who have an email address.
Copy link	Copies the household's address.
WhatsApp	Copies a ready-to-paste message with the link — for relatives who live in group chats, not email.
QR	A QR image for printed stationery. *Print invitations* builds themed stationery with each household's QR.
View	Opens it as the guest would, without counting as an open.
Mute / Unmute	Stops automatic RSVP reminders to that household.
Reissue	Makes a new link. The old one **stops working immediately**.

TICKING IS UP TO YOU

Copying a link or opening a preview **never** ticks anything. Tick *Save the Date Sent* and *Invite Sent* as you actually send, and the Overview, filters and reminders all stay truthful.

CAREFUL WITH REISSUE

It redraws the secret key in the address, which is part of **both** the invitation and the save-the-date link. Both old links stop working. That is the point — use it only if a link has gone astray.

Reminders

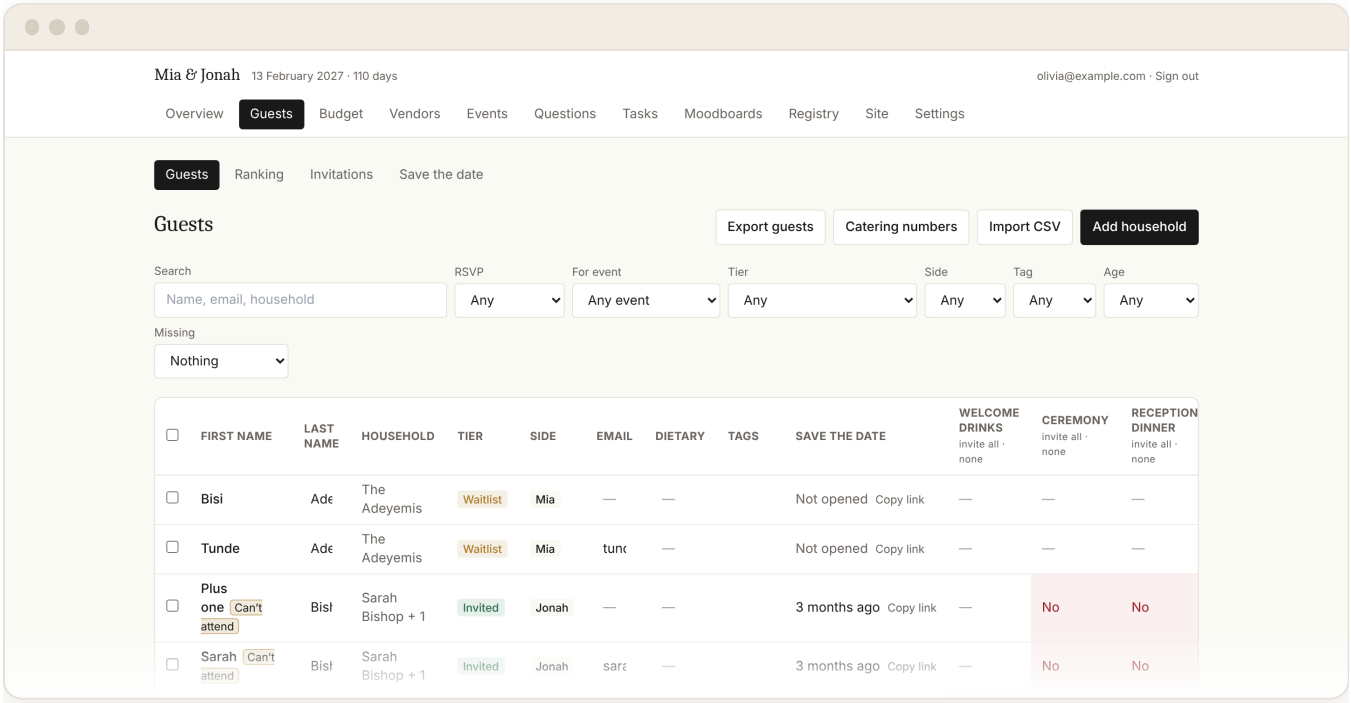

A weekly job reminds households that haven't finished answering — never more than once every ten days, never to a muted household, and it skips any household where everyone has declined.

PART 4

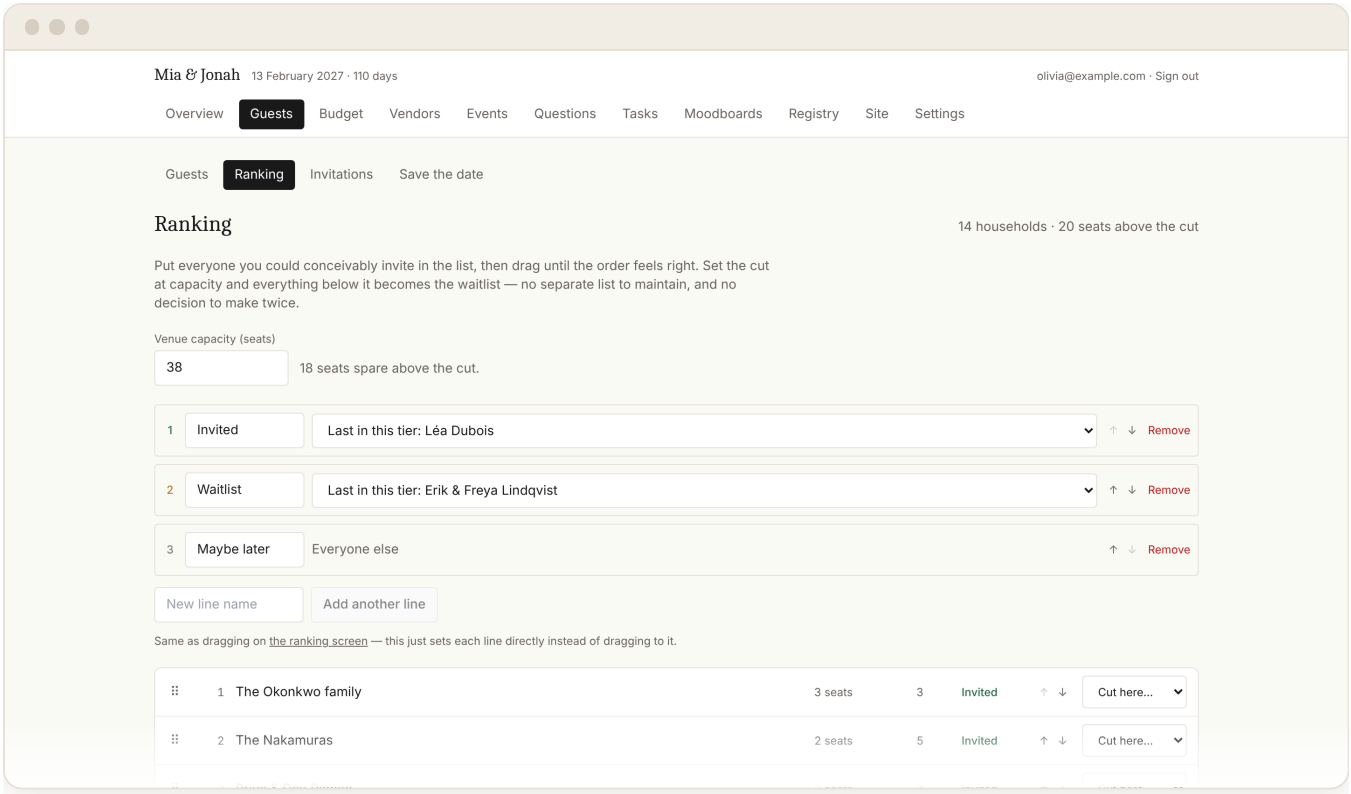

Where everything lives

Eleven entries across the top. A few of them hold several screens, shown as tabs underneath.

Guests · Guests · Ranking · Invitations · Save the date

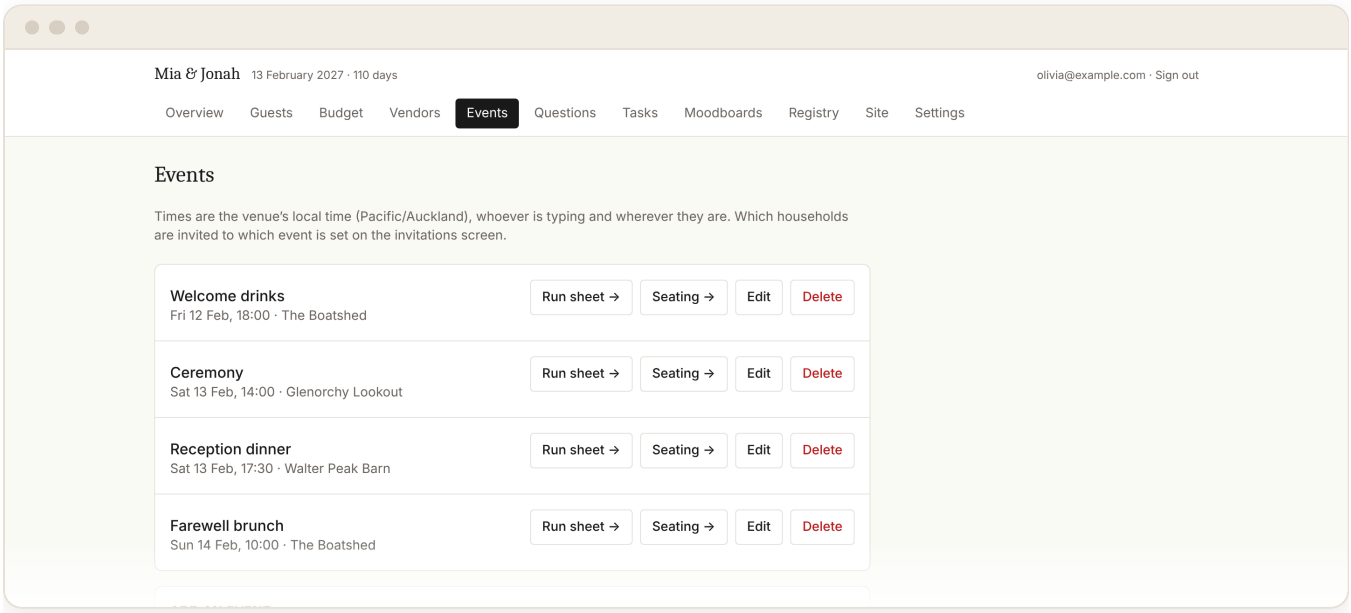

The guest table with filters, CSV import, exports and *Catering numbers*. The event columns are a guest × event grid: click a cell to invite or remove that person, mark an invitation sent, or record an answer someone gave you by text.

Ranking and the cut line. Add everyone you could conceivably invite, drag to put them in priority order, and set the line at venue capacity. Households above it are invited; those below become the waitlist automatically, and when someone declines the screen suggests who fits the freed seats. Tiers come from the order and the lines — move a line and the waitlist updates.

Events · with a run sheet and seating plan each

Events. Each has a time (in the wedding's timezone), a venue and an optional *guest note* that appears on exactly the households invited. Who is invited is set on Guests, not here. Each event opens its own *Run sheet* (the day-of schedule) and *Seating* plan.

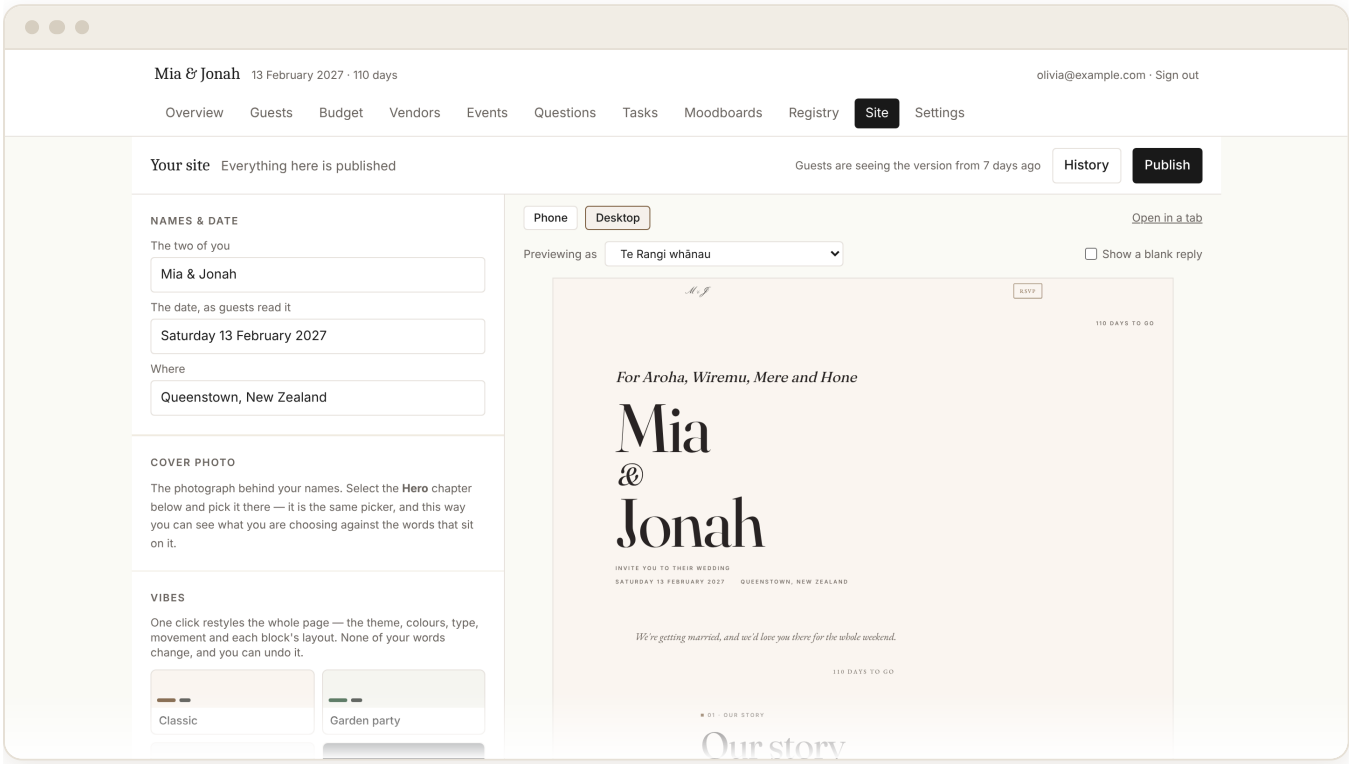

The rest of the top bar

SCREEN	WHAT IT'S FOR
Overview	Where things stand — tasks, responses, capacity, invitations. Every number links to its list.
Budget	Categories and lines in NZD with GST per line. Costs can be flat, **per head** or **consumption-based**, driven by guest numbers, so trimming the list moves the totals. Set an overall budget and a percentage per category; payment schedule per line; link a line to a vendor or a task.
Vendors	Who they are, contacts, notes, and which budget lines they cover. A printable contact sheet. Deleting a vendor never deletes budget lines.
Questions	Extra RSVP questions on top of dietary and access needs (always asked). Per guest (e.g. meal) or per household (e.g. "need a lift?").
Tasks	Lists with due dates, assignees, sub-items and repeats. Views: Today (with an Overdue group), Scheduled, Flagged, All, Assigned to me — plus *Calendar*, *Board* and *Timeline*, which stay in sync automatically. A weekly digest email covers what's due.
Moodboards	One board per audience (florist, dress code…), each shareable by a link with no account. Add images by upload, paste, or the browser clipper.
Registry	Your side of the gift registry — see Part 6.
Site	The block editor for the invitation page — Part 5. Also holds *Getting there* (coach, parking, stays), *Photos* guests upload, songs, guestbook, dress codes.
Settings	Names, date, timezone, capacity and cut lines, collaborator names, **Download everything (.zip)** (a readable copy of your guest data), an Activity log of who changed what, and the privacy notice guests see.

PART 5

Building the invitation site

The Site screen is a column of controls on the left and a live preview on the right. What guests see is always the **last published version** — never your draft.

The editor. Top bar: how many changes are unpublished, and when guests last got a new version (*History* lets you look back or restore). *Previewing as* switches the preview between households, so you can check each one's page.

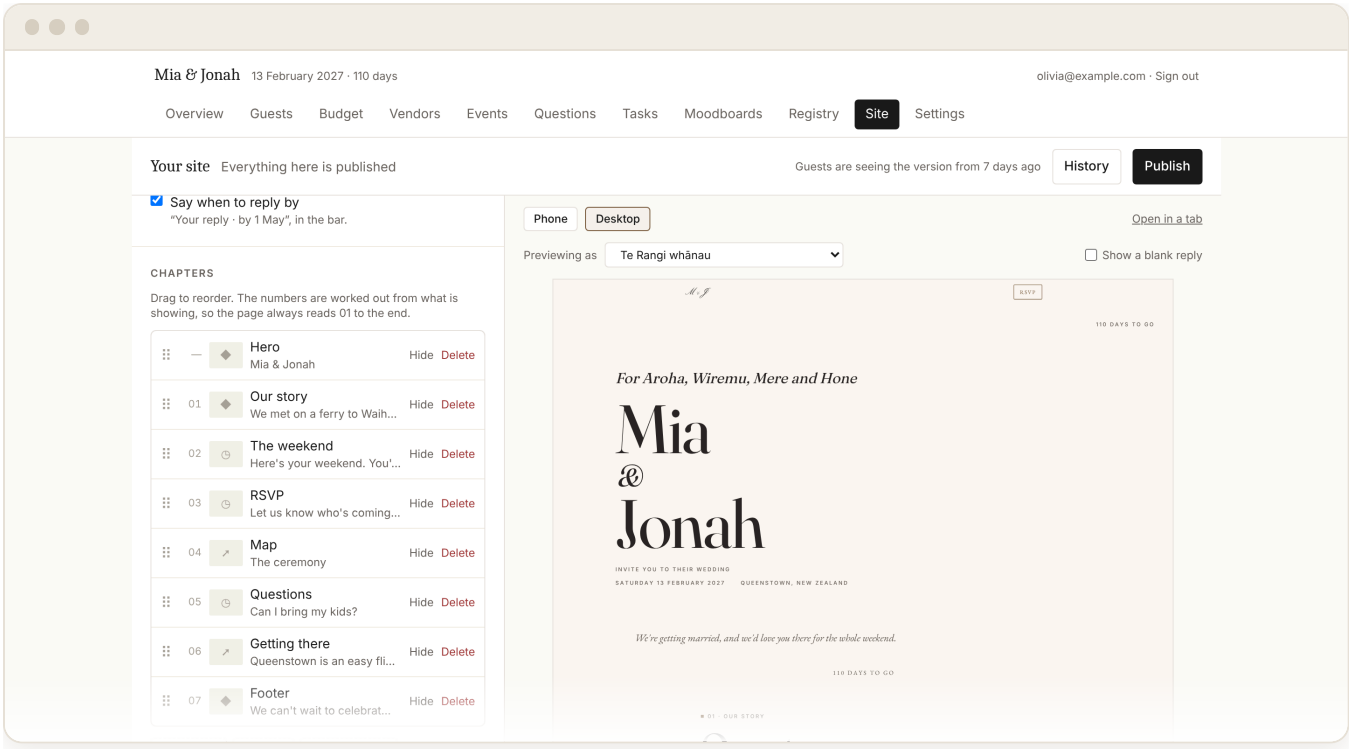

1. **Start from a template**
   Classic, Photo-led or One-pager, if the page is empty — or add blocks yourself.

2. **Write your content**
   Click the preview to jump to that block. A new block arrives with sample text; publishing refuses any block that still has it, so nobody publishes "we met in a queue for coffee".

3. **Pick a look**
   Vibes restyle the whole page in one click; or choose palette, type pairing, motion (Still / Gentle / Cinematic) and per-block text styles. Colours that would be hard to read aren't applied.

4. **Preview as a few households**
   Check that a ceremony-only household really sees only the ceremony.

5. **Publish**
   Guests see the change when you press *Publish*. Edit again as often as you like — nothing reaches guests until the next Publish.

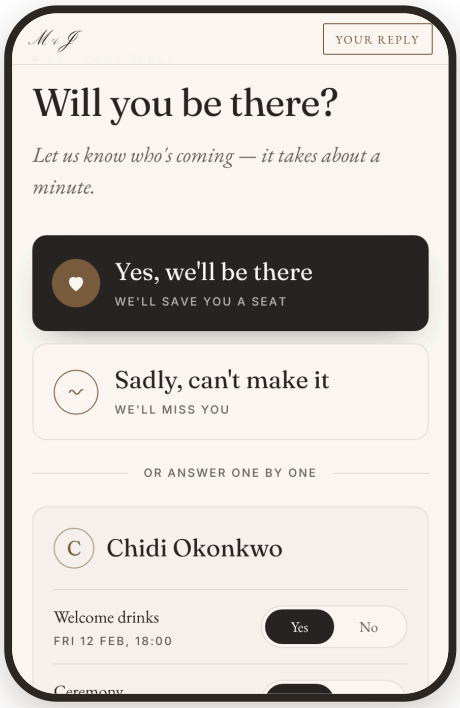

Chapters are the blocks of your page. Drag to reorder (numbers follow automatically), *Hide* one without deleting it, or add more from the dashed buttons below — story, map, "where to stay", coach, your table, a gift, song requests, guestbook...

The guest's view on a phone

The cover, greeting the household by name

The reply form — Yes / No per person, per event

PART 6

The gift registry

- A **public page** at `/registry/<your wedding>` — one address for anyone, independent of invitations, with its own palettes and fonts.
- You add items by pasting a shop link. It tries to fill in the title, picture and price, and is allowed to fail — you can always type them.
- **There are no payments.** It links out to the shop.
- A visitor presses *I'll buy this*, gives a name and an optional message, and the item leaves the page. They see the delivery address and a private undo link.
- **A visitor never sees another visitor's name or message.** You see everything, and move each claim *Claimed → Bought → Arrived → Thanked* by hand.

A suggested order for a new wedding

1. Settings
   Names, date, timezone, venue capacity.
2. Events
   Create each event with its time and venue.
3. Guests and Ranking
   Add or import households, tag them, rank them, set the cut line.
4. Save the date
   Design it, check it with *View*, send it, and tick *Save the Date Sent* as each goes out.
5. Site
   Build and publish the invitation page; use *Previewing as* on a few households.
6. Questions
   Add any extra RSVP questions (meal choice, lifts…).
7. Invitations
   Create invitations (choose events), send, tick *Invite Sent*, then watch answers arrive.
8. Getting there, Photos, Registry
   Switch on what you need.
9. Seating and run sheet
   Once the answers are in.
10. All along: Tasks, Budget, Vendors, Moodboards
    The planning side runs in parallel with the guest side.

REFERENCE

Words you'll see

Household	The unit you invite. It has people, one address, and (once you create it) one invitation.
Guest	A person in a household — the unit for headcount and catering.
Invited per person, per event	A household is invited to a set of events; you can make exceptions for one guest (say, a child not at the evening do). All the numbers follow this one rule.
Cut line / tier	"Invited" is within capacity, then the waitlist, then the rest — worked out from the ranking order, never typed by hand.
Seats vs. people	A household may read "4 people · 3 seats" when someone has said they can't come.
Draft vs. published	Applies to the invitation site: guests see the last published version. The save-the-date goes live when you press Save.

Quick answers

Why can't I open `/w/mia-and-jonah` myself?

There is no shared page. Use *Previewing as* in the Site editor, or a household's own address.

A guest says their link doesn't work.

Most likely it was reissued, or mistyped. Press *Copy link* on their row for the current one.

I renamed a household — did their link break?

No. The readable part can be edited and old links keep working. Only *Reissue* breaks links.

Can a guest forward their link?

Yes, and whoever holds it can answer for that household. That's why it's a private key — if it spreads, Reissue.

A household didn't get the email.

Send emails guests who have an address on file. For everyone else, use Copy link, WhatsApp or the QR code.

Can I edit the site after publishing?

Yes. Edit the draft; guests see changes only when you press Publish again.

About this guide. Screenshots are the real screens running on fictional sample data. This guide describes the app as built; features still being finished (for example, some screens that depend on database updates not yet applied to a live project) may look different when you first use them. No payment processing exists anywhere — the gift pages link out. The Activity log records who changed what but cannot undo it; the site editor has its own undo for deleted blocks and Vibe changes.
